

PRODUCTS INDEX

BUSBAR SYSTEM

BUSBAR

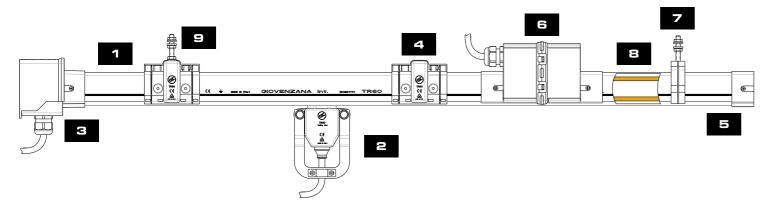

BUSBAR SYSTEM

The "trolley system" series conductors rails is modern and safe system for energy transmission for various types of equipment, such as, cranes, bridge cranes, conveyour belts, chain conveyors, etc...

The "trolley system" complies with the relevant international standards ensuring safety of the operator, easy installation

The new "H" honeycomb profile of the TR85H line guarantees extra endurance and lightness.

TYPICAL LAYOUT

1	BUSBAR	PVC Housing
2	TROLLEY CURRENT COLLECTOR	Transmits the energy from the conductor to the machine
3	HEAD FEED BOX	Connects power supply to the conductors
4	JOINT BOX	Links two busbars
5	END CAP	Closes and protects the busbar end
6	IN-LINE FEED BOX	Connects power supply from centre to avoid the voltage drop
7	HANGER CLAMP	Connects the busbar to the brackets
8	COPPER STRIP	Transmits the energy from the power supply to the current collector
9	FIXED POINT	Creates a fixed point

TYPICAL UTILIZATIONS

CRANE

Cranes and Hoists Electric systems Recycling plans Automated conveyors Galvanized plants

Building Maintenance Units Airport and terminal stations Skyscrapers Cleanroom technology

BMU

PEOPLE MOVER **SYSTEM**

People movers Vertical elevators Inclined elevators

STORAGE

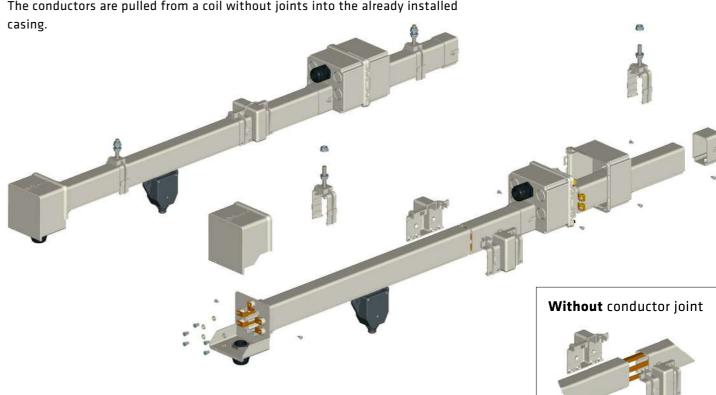

TEXTILE

AIRCRAFT HANGAR DOORS

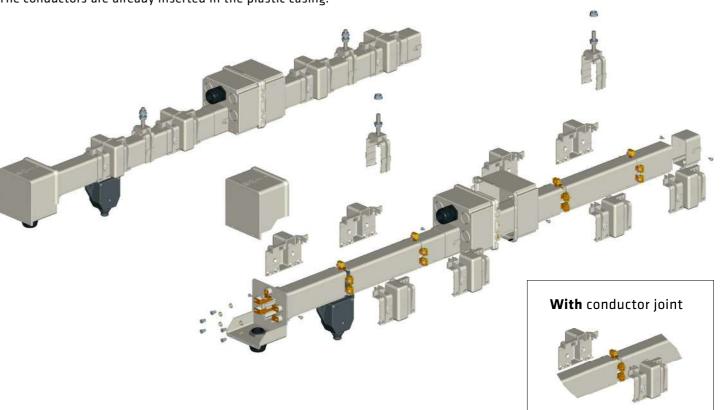

AVAILABLE VERSIONS

A. CONTINUOUS CONDUCTORS The conductors are pulled from a coil without joints into the already installed

B. PRE-MOUNTED CONDUCTORS

The conductors are already inserted in the plastic casing.

BUSBAR SYSTEM | LINE CONSTRUCTION

TECHNICAL

LINE CONSTRUCTION

To decide the size of trolleys it is necessary to consider:

- Maximum current in service
- Devices (cage motors, slip rings motors, resistors, electronic starters)
- Starting current of the devices
- Maximum ambient temperature
- The distance between device to the nearest power feed
- Voltage and admissible voltage drop in continuous and in starting service
- Type of current
- Devices cycle operations (load factor)

CALCULATION OF THE VOLTAGE DROP

Voltage drop should not exceed 5% of rated voltage in normal operating service.

Three phase alternate current:

 $\Delta u = \sqrt{3} \times I \times Lt \times Z$ $\Delta u\% = \frac{\Delta u \times 100}{II}$

Keys:

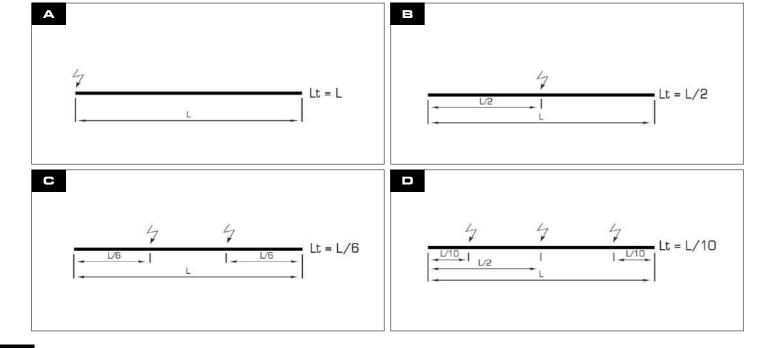

\(\Delta u = Voltage drop [V] \)
\(\Delta u \times = Voltage drop [\times] \)
\(I = Current intensity [A] \)
\(Lt = Length of section [m] \)
\(Z = Impendence [\Omega/m] \)
\(U = Voltage [V] \)

POWER FEED: BUSBAR TRACK LENGHT

A proper disposal of power feed points minimize the voltage reduction.

If "L" is the lenght of the line, "Lt" is the track maximum length to consider the voltage reduction.

- A Lt = L with ending/starting power feed
- E Lt = L/2 with in-line power feed
- Lt = L/6 with power feed at 1/6 from each end
- Lt = L/10 with three power feed at L/2 and L/10 from each end

CURRENT IN CONTINUOUS SERVICE

Specify the number of the devices which work simultaneously to calculate the corresponding current:

$$ln = l_1 + l_2 + l_3 + ...$$

The current can be determined from the devices power [W] that for a three phase system is:

$$In = \frac{Pu}{\sqrt{3} \times U \times \cos \varphi \times \eta}$$

Keys:

In = Current consumption [A]
Pu = Power devices [W]

η = Devices performance

U = Operating Voltage [V]

 $\cos \omega = \text{Power factor}$

 $\cos \varphi$ = Power factor

In the absence of information on the operation of simultaneous devices, consider the following table:

	LIFTING EQUIPMENT IN USE					
N° OF IN-LINE LIFTING DEVICE	1 st ENGINE	2 ND ENGINE	3™ ENGINE	4 [™] ENGINE		
	max power engine*		decreasing power engine*			
1	х	х				
2	х	х	х			
3	Х	Х	x			
4	х	Х	x	х		
5	х	х	х	x		
N° 2 lifting equipment operating simultaneously	х	Х	Х	х		

^{*} About η motors connected in parallel with rated current In', consider In = η x In'.

STARTING CURRENT

Calculate the numbers of the devices started simultaneously and the device already in service, then calculate the corresponding current. If the starting current is unknown, proceed with the following approximation:

For a single user

$$Ia = K \times In$$
 $K = Starting current (Ia)$
Nominal current (In)

As a general rule, consider:

K = 5 to 6 for cage motorsK = 2 for winding motors

K = 2 for inverters (frequency converters)

In the absence of information on the operation of simultaneous devices, consider the following table:

	LIFTING EQUIPMENT IN USE								
N° OF IN·LINE LIFTING DEVICE	1 ST EI	1 ST ENGINE		2 ND ENGINE		3 TH ENGINE		4 [™] ENGINE	
	la	In	la	In	la	In	la la	ln	
1	х			х			•		
2	х			х		х	•		
3	х		х						
4	x		х			х			
5	х		х			х	•	х	
N° 2 lifting equipment operating simultaneously	х		х			х		х

MULTIPOLE SYSTEM

MULTIPOLE

MULTIPOLE SYSTEM

The Multipole System is one of the most used insulated system for transmission of power. The main applications of this system are for mobile power consumer: automatic warehouse, light cranes and packaging machinery. The honeycomb profile guarantees high rigidity and the design of the trolley allow to feed device that have high travel speed (up to 500 m/min).

TYPICAL LAYOUT

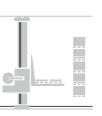

1 BUSBAR	PVC Housing
2 TROLLEY CURRENT COLLECTOR	Transmits the energy from the conductor to the machinery
HEAD FEED BOX	Connects power supply to the conductors
4 JOINT BOX	Links two busbars
5 END CAP	Closes and protects the busbar end
6 IN-LINE FEED BOX	Connects power supply from centre to the conductors
HANGER CLAMP	Connects the busbar to the support (posts, columns)
8 COPPER STRIP	Transmits the energy from the power supply to the current collector
S FIXED POINT	Creates a fixed point to control thermal expansion

TYPICAL UTILIZATIONS

CRANE TECHNOLOGY

Cranes and Hoists Recycling plans Galvanized plants

Electric systems Automated conveyors

PRODUCTION

AUTOMATION

RTG cranes STG cranes

FESTOON SYSTEM

FESTOON SYSTEM

The Festoon System is the traditional system for energy transmission by using cable. The main applications of this system is for mobile power consumer like crane, monorail, electric hoist, machine tools, car wash systems, plating lines, etc...

This feeding system has several advantages:

- Safety the cable are flame resistant, the conductor are completely protected;
- Versatility it can be used for straight rail as curves rail, for indoor and outdoor applications;
- Easy to install;
- The maintenance of the line is extremely reduced.

AVAILABLE VERSIONS

A. LINE 30

- LOAD CAPACITY: 100 kg/m
- Bar size: 30 x 32 mm
- Bar lenght: 4 mt

B. LINE 41

- LOAD CAPACITY: 140 kg/m
- Bar size: 39 x 56 mm
- Bar lenght: 4 mt

C. LINE 41 STAINLESS STEEL

- LOAD CAPACITY: 140 kg/m
- Bar size: 39 x 56 mm
- Bar lenght: 3 mt

D. LINE WIRE-ROPE

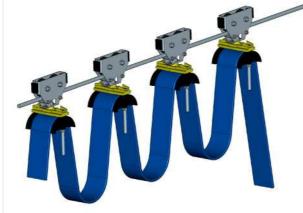

- **TROLLEY LOAD CAPACITY: 8 kg**
- Rope diameter: 8 mm
- Travel speed: 40 m/min

E. LINE I-BEAM Light Series

- TROLLEY LOAD CAPACITY: 50 kg
- I-beam type: IPE-IPN 80÷100
- Travel speed: 120 kg/m
- Max cable capacity: 70 mm

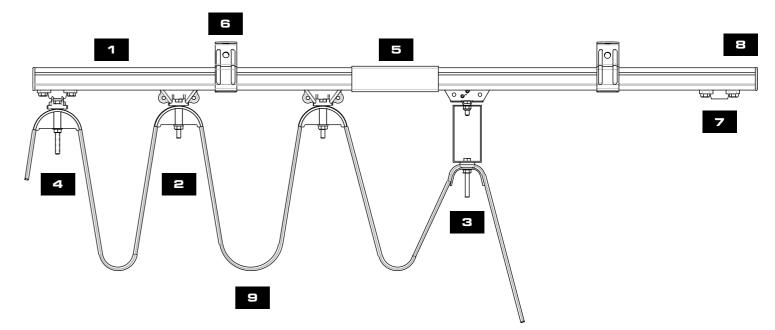

FESTOON

TYPICAL LAYOUT

1 C-RAIL BAR	Steel material
2 TROLLEY	Supports the cable
3 TOWING TROLLEY	Connects to the mobile device and allows the movement
4 HEAD CLAMP	Cable-supporting element without movement
5 JOINT	Connects two C-rail bars
SUPPORT	Holds the C-rail bar
7 END STOP	Prevents the exit of the trolley from the C-rail bar
END CAP	Closes and protects the C-rail bar
SCABLE	Transmits the energy

FESTOON SYSTEM | LINE CONSTRUCTION

FESTOON SYSTEM

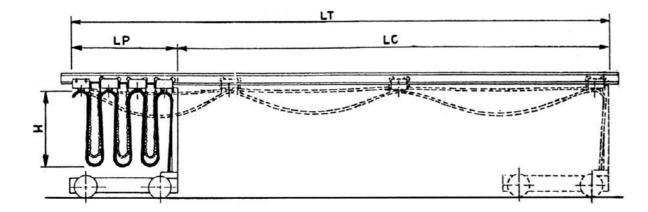

LINE DIAGRAMS

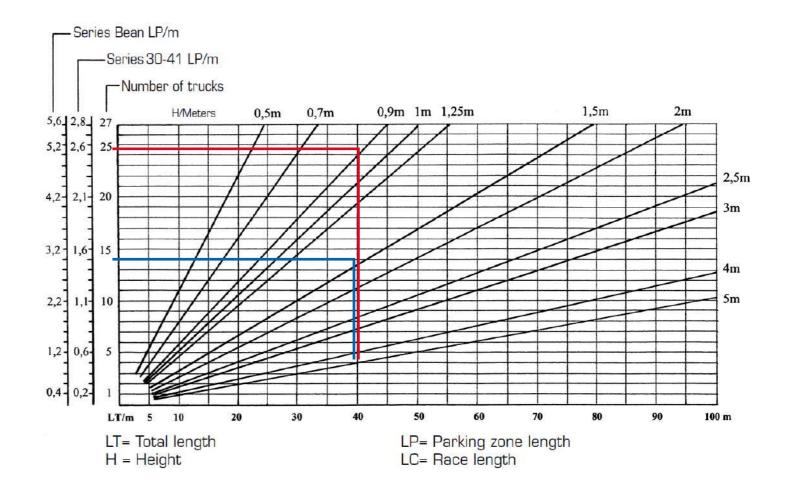

LINE 30 / 41 / 41 Stainless Steel

LINE WIRE-ROPE

LINE I-BEAM

BLUE Example

Total line length "LT" = 40 mt Height "H" = 2 mt Number of trolley/trucks = 12 pcs Parking zone length "LP" = 1,2 meters Race length "LC=LT-LP" = 38,8 meters

RED Example

Total line length "LT" = 40 meters Height "H" = 1 meters Number of trolley/trucks = 21 pcs Parking zone length "LP" = 2,2 meters Race length "LC=LT-LP" = 37,8 meters

The diagram is used to determine the number of trolley necessary for the formation of the line, depending on its lenght.

The height of the loop determines how many trolley are needed and thus their parking area. Where the parking area is too long at the expense of running real user, it must increase the height of the loops, thus decreasing the number of trolleys required and therefore the parking area. To determine the cable lenght of a garland to increase by 10% the total lenght of the line and add enought to connect the two ends of the fixed and mobile users.
